ABSTRACT

This project focuses on developing a Unified Military Analytics and Comparison Dashboard that collects, cleans, and analyzes global military strength data. The system uses automated web scraping, data cleaning, and KPI engineering to extract country-level military metrics from open-source platforms like GlobalFirepower. After processing the data, the project generates a cleaned dataset suitable for visualization and comparison across 140+ countries.

The dashboard allows interactive exploration of aircraft strength, naval assets, budget distribution, personnel count, and military rankings.

PROJECT OVERVIEW

The Unified Military Analytics Dashboard is designed to centralize and analyze military

capability data gathered from reliable online sources. This system enables users to compare

multiple countries based on key military indicators and provides automated data cleaning modules to standardize inaccurate, inconsistent, or missing fields.

OBJECTIVES & SCOPE

Objectives:

- Scrape military data from multiple country profile URLs.
- Clean and convert raw data into a structured numerical format.

Scope Included:

✓ Global military metrics ✓

Data collection & cleaning

Scope Excluded:

✗ Real-time war prediction

✗ Classified intelligence

SYSTEM ARCHITECTURE Workflow:

1. Web Scraping Module

2. Raw Data Storage

3. Cleaning & Processing

MODULE 1 — DATA COLLECTION

Tasks:

- Load URLs

- Scrape military metrics

- Save raw CSV

Tools:

- Python, Requests, BeautifulSoup

MODULE 2 — DATA CLEANING

Tasks:

- Remove commas, %, + symbols

- Convert strings to numbers

- Handle missing values

Output: military_cleaned.csv

TESTING & VALIDATION

Tests:

✓ URL success rate ✓

Data type validation

OUTPUT & RESULTS

- Raw dataset generated
- Clean dataset prepared

CONCLUSION

The project successfully automated military data extraction and analysis, enabling structured

FUTURE ENHANCEMENTS

- Add ML forecasting
- Integrate real-time feeds
- Include geopolitical scoring
