

Unified Military Analytics and Comparison Dashboard – Documentation

Infosys Springboard Virtual Internship 6.0

Reported by: Karthik Baliga

1. Project Overview

The Unified Military Analytics and Comparison Dashboard is a data analytics project aimed at collecting, cleaning, and organizing country-wise military data. The prepared datasets are intended for comparative analysis and dashboard visualization.

2. Module 1: Data Scraping

This module focuses on extracting military-related metrics for multiple countries using a predefined list of URLs stored in the file `links for military data.txt`.

The Python script `scrape_military_metrics.py` reads the URLs, accesses the corresponding web pages, and extracts country-level military values. The collected information is stored in raw format without modification.

Output File: `military_raw_data.csv`

3. Module 2: Data Cleaning and Processing

The raw dataset contains symbols, textual values, and inconsistent formats that are not suitable for direct analysis. A cleaning process was applied using a Jupyter Notebook.

The notebook `clean_data.ipynb` removes unwanted characters, converts all values into numeric format, and handles missing data to ensure consistency across all records.

Output File: `military_cleaned.csv`

4. Tools and Technologies Used

Python was used as the primary programming language. Pandas library was used for data manipulation and CSV handling. The implementation was executed using Python scripts and Jupyter Notebook.

5. Files Included in the Project

`links for military data.txt` – Input URL list

`scrape_military_metrics.py` – Data scraping script

`military_raw_data.csv` – Raw collected data

`clean_data.ipynb` – Data cleaning notebook

`military_cleaned.csv` – Final cleaned dataset

6. Summary of Work Done

- Extracted military data using automated scraping
- Generated raw and cleaned datasets
- Standardized values for analysis
- Prepared data for dashboard visualization
