

Module 5: Build Quick Stats and Nation Overview Dashboards

Project: Unified Military Analytics and Comparison Dashboard

Author: Yogeshwar Vadla

Internship: Infosys Springboard

Domain: Data Visualization

1. Methodology

Module 5 focused on implementing fully functional dashboard pages in Power BI based on the planned wireframes and KPI-engineered dataset developed in previous modules. The objective was to build interactive, dynamic, and analytically meaningful dashboards that support both global-level and country-level military analysis.

A. Quick Stats Dashboard (Global-Level Analysis)

Objective

To present a high-level global overview of military strength indicators with interactive filtering and dynamic KPI updates.

Implementation Steps

1. Top 10 Countries by Power Index

A ranked bar chart was created to display the top 10 countries based on Power Index. Since lower Power Index values indicate stronger military capability, sorting was configured in ascending order. This visual enables quick identification of the strongest military nations globally.

2. KPI Cards with Dynamic Values

Dynamic KPI cards were developed using DAX measures to ensure real-time recalculation based on filters. The KPI cards include:

- Budget-to-GDP Ratio
- Defense Budget (USD)
- Defense Budget per Capita
- Total Military Manpower

These KPIs dynamically update when filters such as region, continent, alliance, or country selection are applied.

3. Interactive Filters

The following filters were implemented:

- Region
- Continent
- Alliance (NATO / Non-NATO)
- Country Search

Cross-filtering was enabled so that all visuals respond consistently to user selections. This ensures cohesive analytical interaction across the dashboard.

4. Supporting Visualizations

Additional visuals were incorporated to enhance analytical depth:

- Regional Assets per Capita distribution chart
- Population versus Military Manpower donut chart
- Defense Budget versus Military Manpower comparison chart
- Global map visualization for geographic distribution

The layout follows a structured analytical hierarchy: summary KPIs at the top, ranking visuals in the middle, and geographic and comparative visuals at the bottom.

B. Nation Overview Dashboard (Country-Level Analysis)

Objective

To provide a comprehensive military and economic profile of a selected country with dynamic comparison capability.

Implementation Steps

1. Country Selection Mechanism

A country search and slicer were implemented to allow users to select a specific nation. Once selected, all KPI cards and visuals dynamically update to reflect that country's metrics.

2. KPI Summary Cards

The following KPIs were displayed for the selected country:

- Total Population
- Assets per Capita
- Power Index Rank
- Defense Budget (USD)
- Military Manpower

These KPIs provide a concise summary of the country's military and economic profile.

3. Analytical Visualizations

The following visual components were implemented:

- Bar chart comparing total population and military manpower
- Defense budget versus total military manpower comparison chart
- Scatter-style comparison of manpower and population
- Geographic map highlighting the selected country

These visuals enable users to understand scale, proportionality, and relative strength.

4. Tooltips and Contextual Enhancements

Custom tooltips were added to include rank information and comparative metrics. This improves analytical clarity without overcrowding the dashboard.

2. Insights

Quick Stats Dashboard Insights

- Military strength concentration is clearly visible among top-ranked nations.
- Defense spending varies significantly across continents and alliances.
- Some countries allocate a higher proportion of GDP to defense despite smaller economies.
- Military manpower is not always directly proportional to defense budget size.
- Regional filtering reveals defense concentration patterns and strategic clusters.
- Alliance-based filtering supports comparative geopolitical analysis.

Nation Overview Dashboard Insights

Using the example of Nepal:

- Military manpower represents a smaller proportion relative to total population.
- Defense budget allocation is moderate compared to overall population size.
- Power Index rank provides clear positioning in the global hierarchy.
- Comparative charts highlight the relationship between economic capacity and military scale.
- Geographic visualization enhances understanding of regional strategic context.

3. Deliverables Achieved

Sample Application of Dashboard

- Fully interactive Quick Stats dashboard
- Fully interactive Nation Overview dashboard
- Dynamic KPI recalculation
- Filter-driven analytical interaction
- Consistent visual design across pages

Fully Built Dashboard Tabs

- Quick Stats (Global Overview)
- Nation Overview (Country Profile)

Both dashboards are complete, operational, and aligned with the project objectives defined in Module 5.

Module 5 Outcome

Module 5 successfully transformed the planned wireframes and KPI-engineered dataset into fully functional Power BI dashboards. The implementation supports both macro-level global analysis and micro-level country profiling through dynamic filtering, real-time KPI updates, and structured visual storytelling.

This module represents the final implementation phase of the Unified Military Analytics and Comparison Dashboard and delivers a professional-grade interactive analytical solution suitable for presentation and evaluation.
